C C All Manar non-collagen or non-myslin basic protein of colorism and individual to an individual to an individual to an individual to an individual to that polypeptide. In both cases, the colorising an individual to that polypeptide. In both cases, the colypeptide (whether self or non-self) includes an amino acid consequence corresponding to a sequence motif for a MHC class II colorism self or non-self) includes an anino acid colorism self or a colorism and colorism and colorism self or a colorism and antoin mune colorism self or non-self) and that human autoimmune colorism in individuals with the autoimmune disease. This peptide is derived from the human desmoglein 3 protein and acids 190-204) and is implicated as a self epitope in pemphigus vulgaris. Peptides of and is implicated as a self epitope in pemphigus vulgaris. Peptides in andividuals with the autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

CC The patent describes a new preparation of microparticles each
CC comprising a polymeric matrix and a nucleic acid. The polymeric
CC matrix consists of one or more synthetic polymers having a solubility
CC in water of less than 1 mg/l (e.g. poly-lactic-co-glycolic acid);
CC and at least 90% of the microparticles have a diameter of less than
CC 100 microns. The microparticles are useful for the delivery of nucleic
CC acids to phagocytic cells. In one embodiment the microparticles are
CC less than 20 microns in diameter and the nucleic acid (preferably in
CC closed circular form) includes an expression cortrol sequence
CC coperatively linked to a codding sequence, where the expression product
CC of the coding sequence is a polypeptide having a length and a sequence
CC which permits it to bind to an MHC class I or II molecule. The
CC response in mammals. The present sequence stimulator of an immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

A microparticle preparation (MP) has been developed, consisting of microparticles having a diameter of less than 100 mu m. The MP comprises:

(a) a polymeric matrix (PM) consisting of one or more synthetic polymers having a solubility in water of less that 1 mg/l; and (b) an expression vector selected from RNA molecules (at least 50% of which are closed circles) or circular plasmid DNA (at least 50% of which are supercoiled).

Also described is a MP of at most 20 microns in diameter, comprising; (a) a PM; and (b) a NAM comprising an expression control sequence operatively linked to a coding sequence, where the coding sequence encodes an expression product selected from; (1) a polypeptide at least 7 amino expression product selected from; (1) a polypeptide at least 7 amino expression in least 10 and 10 a sequence identical to the sequence of: (1) a fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21-JUL-1998.

This sequence represents a fused protein recognised by pemphigus foliaceus patient autoantibody which comprises the constant region of IgG linked to the extracellular region of pemphigus foliaceus is a chronic, generalised, vesicular and scaling skin eruption similar to dermatitis herpetiformis. The pemphigus foliaceus antigen fusion protein is useful to treat pemphigus foliaceus. The antigen is especially administered through an adsorbent upon which the fusion protein is immunodiagnosis. The fusion protein has little or no side effects.
                                                                                                                                                                               Query Match

W69763 to W69765, and W78793 to W78897 are peptide fragments for use in the present invention. The MPS are highly effective vehicles for the delivery of polynucleotides into phagocytic cells. They can be used for gene therapy, e.g. for treating genetic diseases, infections or tumours or for downregulating an immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 17-JUN-1997 (first entry)

Purified human E-cadharin protein and nucleic acid - used to develop prods. for diagnosis, prognosis, therapy and prophylaxis of t-cadherin disorders, e.g. malignancies

Claim 1: Page 59-63; 97pp; English.

E-cadherin is a cell adhesion molecule that is also known as conditional cell cam 120/80. The DNA encoding hEC was obtd. by screening normal human liver and hepatocellular carcinoma cDNA libraries and a colonic epithelial cell cDNA library. The following sequences are specifically claimed: AAs 1-878; 151-878; 30 colonic epithelial cell cDNA interacy. The following sequences are specifically claimed: AAs 1-878; 151-878; 30 colonic epithelial cell cDNA interacy. The following sequences are specifically claimed: AAs 1-878; 151-878; 30 colonic epithelial cell cDNA interacy. The following sequences are specifically claimed: AAs 1-878; 151-878; 30 colonic epithelial cell cDNA interacy. The following sequences are specifically claimed: AAs 1-878; 151-878; 30 colonic expression. Suncleotide sequences comprising nucleotide numbers 116-2749; 566-2749; 1-1053; 510-2696; 1332-3000; 540-1500; 348-906; 890-1648; 384-1208; 641-2046; 685-1336; 880-1661; 1199-1742; 1373-1742; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744; 170-1744
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The human E-cadherin protein precursor (R85487) is expressed by an cDNA clone (T05764) derived from human liver. The extracellular domain of E-cadherin is used to generate peptides that specifically bind to heterotypic cognates of E-cadherin and which inhibit adhesion of intra-epithelial T-lymphoty to E-cadherin-expressing epithelial or endothelial cells in vitro or in vivo, thereby modulating mucosal immune responses. Such peptides are also specifically reactive with a monoclonal antibody (E4.6 or E6.1) that binds to E-cadherin and that can inhibit T-cell binding.
                                                                                                                                                                                                                                                                                                        Salmonella typhimurium
                                                                                                                                                                                                                                                                                                                                 Virulence gene cluster polypeptide product. The products and methods can be used for identifying virulence genes in microorganisms. The mutant microorganisms can be used in vaccines or to screen for drugs which reduce virulence or compounds useful for preventing, ameliorating or treating infections in animals or plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a unique marker sequence so that each microorganism; (2) providing marker sequence, or clones of the said microorganism; (2) providing individually a stored sample of each mutant produced by step (1) and providing individually stored nucleic acid comprising the unique marker sequence from each individual mutant; (3) introducing a plurality of mutants produced by step (1) into the said particular environment and allowing those microorganisms which are able to do senvironment and allowing those microorganisms which are able to do senvironment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2873
                                                                                                                                                                                                                                                                                                                                               Recombinantly generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of order Mononegavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus places page 246-254; 426pp; English.

This sequence represents the wild-type L protein from Human parainfluenza virus (HPIV-3) type 3 isolate JS. This sequence is used in a method which involves the isolation of recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3' genomic promoter region and at least 1 attenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against such a virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              a unique marker sequence so

      PT Recombinantly generated, attenuated, non-segmented, negative-sense, pri single stranded RNA virus of order Mononegavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus pri polymerase gene, useful as vaccine to immunise against such virus PT polymerase gene, useful as vaccine to immunise against such virus PT polymerase gene, the Human parainfluenza virus (HPIV-3) type 3 cracine FRhl cp45 L protein. This sequence is used in a method which converted the protein region and the virus of the order converge region and at least 1 attenuating mutation in the 3' genomic promoter region and at least 1 attenuating mutation in the RNA colymerase gene, This RNA virus can be used as a vaccine to immunise an conjunctional against such a virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

W48712;
Recombinantly generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of order Mononegavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus plsclosure; Page 283-291, 425pp; English.

This sequence represents the Human parainfluenza virus (HPIV-3) type 3 vaccine vero cp45 L protein. This sequence is used in a method which involves the isolation of recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3' genomic promoter region and at least 1 attenuating mutation in the RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (AMCY ) AMERICAN CYANAMID CO.

T HUCEP-1 protein having neuron function activating activity - useful for treating ischaemic brain diseases and nerve denaturation conditions such as Parkinson's and Alzheimer's diseases.

C Claim 1; Fig 4; 17pp; Japanese.

C The present sequence represents human cerebral protein-1 (HUCEP-1).

C HUCEP-1 has neuron function activating activity. HUCEP-1 is useful conditions such as Parkinson's and Alzheimer's diseases.

```
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein search, using sw model

DISEASE: PEMPHIGUS VULGARIS (PV) IS A POTENTIALLY LETHAL SKIN DISEASE IN WHICH EPIDERWAL BLISTERS OCCUR AS THE RESULT OF THE LOSS OF CELL-CELL ADHESION CAUSED BY THE ACTION OF AUTOANTIBODIES AGAINST DSG3.

SIMILARITY: BELONGS TO THE CADHERIN FAMILY. DESMOSOMAL SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                          PF00028;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 22222

-i- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS. THEY PREFERENTIALLY INTERACT WITH THEMSELVES IN A HOMOPHILIC MANNER IN CONNECTING CELLS; CADHERINS MAY THUS CONTRIBUTE TO THE SORTING OF HETEROGENEOUS CELL TYPES. N-CADHERIN MAY BE INVOLVED 1 NEURONAL RECOGNITION MECHANISM.

-i- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. "Expression of XBcad, a novel cadherin, during oogenesis and early development of Xenopus.";

Mech. Dev. 35:33-42(1991).

-I- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.

-I- FUNCTION: CADHERINS ARE CALCIUM THEMSELVES IN A HOMOPHILIC MANNER IN CONNECTING CELLS; CADHERINS MAY THUS CONTRIBUTE TO THE SORTING OF HETEROGENEOUS CELL TYPES.

T'Human aldehyde dehydrogenase. Purification and characterization of a Third isozyme with low Km for gamma-aminobutyraldehyde.";

L J. Biol. Chem. 264:4715-4721(1989).

-!- FUNCTION: HAS A WIDE SUBSTRATE SPECIFICITY AND A LOW KM FOR 4-AMINOBUTYRALDEHYDE. ITS OPTIMAL PH DEPENDS UPON SUBSTRATE.

C -!- FUNCTION CACTIVITY: ALDEHYDE + NAD(+) + H(2)O = ACID + NADH.

C -!- CATALYTIC ACTIVITY: 4-AMINOBUTANAL + NAD(+) + H(2)O = 4-AMINOBUTANOATE + NADH.

C -!- SUBUNIT: HOMOTETRAMER.

C -!- TISSUE SPECIFICITY: HIGH EXPRESSION IN ADULT LIVER, SKELETAL G. BEALU.

G BRAIN.

C --- AND KIDNEY. LOW LEVELS IN HEART, PANCREAS, LUNG, AND

Claim 1: Page 38; 58pp: English.

Pharmaceutical preparations for tolerisation to antigens comprise either an isolated human non-collagen or non-myslin basic protein (MBP) polypeptide which is capable of tolerising an individual to an autoantigen; or an isolated human pathogen polypeptide capable of tolerising an individual to that polypeptide. In both cases, the polypeptide (whether self or non-self) includes an amino acid sequence corresponding to a sequence motif for a MHC class II protein, such as HLA-DR, which is associated with a human autoimmune disease and which binds to the polypeptide to activate autoreactive disease and which binds to the polypeptide to activate autoreactive and implicated as a self epitope in pemphigus vulgaris. Peptides derived from the human desmoglein 3 protein are described in W04841-47.

This sequence represents a fused protein recognised by pemphigus foliaceus patient autoantibody which comprises the constant region cof IgG linked to the extracellular region of pemphigus foliaceus is a chronic, generalised, vesicular and scaling skin eruption similar to dermatitis herpetiformis. The pemphigus foliaceus antigen fusion protein is useful to treat pemphigus foliaceus antigen is cespecially administered through an adsorbent upon which the fusion protein is immunobilised via a carrier. The fusion protein is also useful for detecting pemphigus foliaceus antibodies which is useful in immunodiagnosis. The fusion protein is also useful for detecting pemphigus foliaceus antibodies which is useful in immunodiagnosis. The fusion protein is also

Purified DNA encoding human cystathionine beta-synthase -
Purified DNA encoding human cystathionine beta-synthase, used for
for producing human cystathionine beta-synthase, used for treating homocystinuria Claim 7; Fig la-c, 45pp; English.
The amino acid sequence shown in R71376 is the human cystathionine beta-synthase (CBS). Human CBS can be used to treat patients with homocystinuria and the cDNA sequence, Q87430, from which it is derived is also useful for screening CBS deficient patients for mutations in the CBS gene.

Fused protein recognised by pemphigus vulgaris auto:antibody - useful to treat and diagnose pemphis vulgaris
Claim 1; Page 7-9; 9pp; Japanese.
W07908 represents the human pemphigus vulgaris (PV) antigen extracellular region. The PV antigen is produced in patients with pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing superall, intra-epidermal bullae (vesicles) of the skin and mucuous membranes, which is fatal if untreated. The PV antigen was fused to a human IgG1 hinge region and the resulting fusion protein is useful to treat or diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding pemphiqus vulgaris antigen - useful in proteins for diagnostic and therapeutic uses Disclosure; Fig 7; 50pp; English.

This sequence is the pemphigus vulgaris 130kD antigen. The protein and its encoding DNA may be used in the diagnosis and treatment of pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.

Mycobacterial DNA vectors containing reporter constructs - for identifying coding or promoter sequences involved in infection-associated protein expression

Claim 32; Fig 18F; 309pp; French.

Sequences Y04742-Y05000 and Y07201-y07204 represent secreted proteins from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.

The E2 and E3 genes have been cloned and can be used for the recombinant production of BCV polypeptides, using e.g. Spodoptera frugiperda Sf9 insect cells as host cells. Glycosylated and non-glycosylated recombinant E2 and E3 (see W31707) are useful as components of vaccines directed toward preventing BCV infection, or reducing the severiof BCV infection, in bovine populations.

Claim 2; Fig 1f; 20pp; Japanese.

DNA encoding the protein can be inserted into an expression vector for the prodon. of MG-1 polypeptide which elivits in intigen-antibody reaction with anti-mycoplasma gallisepticum poultry sera. It may also be ligated to other DNA to produce fusion proteins with an N-terminal bacterial enzyme sequence.

The present sequence is a segment of the desmosomal cadherin (DC), desmoglain Bg2, which is exposed on the surface of epithelial or carcinoma cells and not bound to desmosomes. An antibody (Ab) of directed against epitopes of the present sequence can be used to diagnose, i.e. to detect carcinoma cells, especially micrometastases, not bound to desmosomes, to separate, enrich or detect living or fixed carcinoma cells by cell sorting methods and cas a therapeutic to deliver agents, e.g. other Ab or toxins, to metastatic carcinoma, and detects parts of DC that are not accessible in desmosome bound cells, as in normal tissue or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DE19531033-A1.

Vaccines against bovine coronavirus - containing recombinant bovoronavirus polypeptide(s)
Claim 13; Fig 3; S2pp; English.
This polypeptide comprises the E2 protein, also designated peplomer protein or S (Spike), of bovine coronavirus (BCV). It has a moll.wt. of 150 kDa exclusive of glycosylation and contains 21 potential N-linked glycosylation sites. The amino acid sequence was deduced from an clone E2 cDNA (see T89387). The E2 gene in plasmid pri8E2 (E. coll JM105) is deposited as ATCC 68041. The BCV E3 gene (see T89388) is immediately 5' of the E2 gene on the viral genome and terminates 14 nucleotides upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bovine coronavita

(TIGR*) protein, that is highly induced by glucocorticoids in the
endothellal lining of the human trabecular meshwork (HTM). The
sequence was deduced from an isolated cDNA clone (see V33484).
Studies of the recombinant protein suggest (1) that the 55 kDa
protein exists both in cells and in the medium, (2) that it
undergoes oligomerisation, (3) phosphorylation, (4) glycosylation,
(5) that it is susceptible to metalloprotease, (6) that it
exhibits high affinity binding to extracellular matrix and HTM
cells, (7) that it exhibits progressive inductions with time in
both cell and organ cultures, and (8) that it exhibits high
expression in the HTM of glaucomatous patients as compared to
normal patients. TIFR* cDNA, the protein itself, molecules that
bind it, and nucleic acid molecules that encode it, provide
improved methods and reagents for diagnosing glaucoma and related
disorders, such as cardiovascular and immunological diseases that
affect expression of TIGR*. A claimed method of diagnosing glaucoma
involves determining if the amount of TIGR* present in the HTM
exceeds the amount found in an individual not predisposed to the
                        Claim: 1; Column 25-28; 22pp; English.
Claim: 1; Column 25-28; 22pp; English.
This sequence represents the human Trabecular meshwork induced glucocorticoid response (TIGR) protein. The TIGR protein is a sportein specifically bound by the antibody of the invention. The antibody, especially in labelled form, can be used in the diagrigation of the protein in the transcript of the eye. Using the antibody, glaucoma is detected resembly of the eye. Using the antibody, glaucoma is detected resembly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (REGC

CC The secretory protein is designated TiGR (Trabecular Meshwork Induced CC The secretory protein is designated TiGR (Trabecular Meshwork Induced CC Glucocorticoids in the endothelial lining cells of the human trabecular meshwork. The TIGR polynucleotides and proteins can be used as markers (for the diagnosis of glaucoma, primary open angle glaucoma (POAG), CC pigmentary glaucoma, and low tension glaucoma and their related diseases. They can also be used to diagnose or protect an individual's sensitivity to elevated intraocular pressure upon administration of steroids such as glucocorticoids or corticosteroids. These products can also be used for diagnosing other diseases or conditions that affect the expression or activity of the protein. The products can also be sequence 504 AA;

Derivatives of GLCIA gene can be used to detect lesions of the GLCIA gene which are indicative of glaucoms or predisposition to glaucoma.

Sequence 504 AA;
Use of TIGR nucleic acid sequences - used for, e.g. developing products for diagnosis, prognosis and treatment of glaucoma Claim 48; Fig 8; 105pp; English.

This sequence represents a novel human trabecular meshwork induced glucocorticoid response protein (TIGR) which is used in a method for
                                                                                                                                                                                                                                                                                                                                                                                                            Human TIGR protein.
TIGR; trabecular meshwork induced glucocorticoid response protein; diagnosis; glaucoma; polymorphism; steroid sensitivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   products to determine whether a subject has, or is at risk of, developing glaucoma, and for treating or preventing glaucoma developing glaucoma, and for treating or preventing glaucoma Disclosure; Pages 92-94; 116pp; English.

This represents a human GLC1A protein sequence. The human GLC1A gene is associated with juvenile open angle glaucoma (JOAG). The gene can be us for the development of assays for identifying molecules that modulate (agonists or antagonists) the bloactivity of a functional or mutant gen or protein. Modulators may be an antibody, protein, peptide or peptidomimetic or a nucleic acid, e.g. antisense sequence, ribozyme or triple helix forming nucleic acid. These molecules can be administered as a subject of the forming nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        N-PSDB, V37618, V37619.

                                                                                                                                                                                       diagnosing glaucoma in a patient. The method involves the dei polymorphisms whose presence is predictive of a mutation afforesponse in the patient and can be diagnostic of glaucoma or sensitivity. Base substitutions and base additions upstream or TIGR exons can also be used to diagnose glaucoma. Sequence 504 AA;
